Consider a harmonic oscillator in 1D, with

$$H_0 = \frac{P^2}{2m} + \frac{1}{2}m\omega^2 X^2 , \quad [X, P] = i\hbar$$

introduce lowering and raising operators, such that

$$X = \frac{a}{\sqrt{2}} (a_+ + a_-) , \quad P = \frac{i\hbar}{\sqrt{2}a} (a_+ - a_-)$$

$$a_- |n\rangle = \sqrt{n} |n-1\rangle , \quad a_+ |n\rangle = \sqrt{n+1} |n+1\rangle$$

on the eigenstates of  $H_0$   $|n\rangle$  with spectrum  $E_n^0 = \hbar\omega(n+\frac{1}{2})$

$a = \sqrt{\frac{\hbar}{m\omega}}$  is the natural length scale.

(2)

$$H_0 = \hbar\omega_0 \left\{ a_+ a_- + \frac{1}{2} \right\}$$

$$H_0 |n\rangle = E_n^0 |n\rangle \quad , \quad E_n^0 = \hbar\omega(n + \frac{1}{2}) \quad , \quad n = 0, 1, 2, \dots$$

We can find the matrix element

$$\langle n | \hat{x} | m \rangle = \frac{1}{2} \sqrt{n+m+1} S_{|n-m|,1}$$

So, in the basis  $\{|n\rangle\}$  the operator  $\hat{x}$  can be represented by an infinite matrix. In the same way  $H_0$  is represented by an infinite diagonal matrix

$$\langle n | H_0 | m \rangle = \hbar\omega(n + \frac{1}{2}) S_{n,m}$$

How about  $x^2$ ?

$$\langle n | \left(\frac{x}{a}\right)^2 | m \rangle = \langle n | \left(\frac{x}{a}\right) \left(\frac{x}{a}\right) | m \rangle$$

Now use the completeness relation

$$1 = \sum_{p=0}^{\infty} |p\rangle \langle p|$$

$$\langle n | \left(\frac{x}{a}\right)^2 | m \rangle = \sum_{p=0}^{\infty} \langle n | \left(\frac{x}{a}\right) | p \rangle \langle p | \left(\frac{x}{a}\right) | m \rangle$$

If we had noted the matrix for the operator by  $\times$  then we see from this that the matrix for  $x^2$  is just  $\times \cdot \times$  where matrix multiplication is used.

a) find the energy spectrum for

$$H = H_0 + \lambda \hbar \omega \left(\frac{x}{a}\right)^4$$

for  $\lambda \in [0, 1.2]$  for an appropriately truncated basis. Test the truncation.

b) The eigenstates  $|x\rangle$  of  $H$  are a linear combination of the original basis

$$|x\rangle = \sum_{n=0}^{\infty} C_{xn} |n\rangle$$

and the coefficients  $C_{xn}$  come from the eigenvectors of  $H$ . Show with column-graphs the contribution of basis states to the lowest energy states  $|x\rangle$ .  $|C_{xn}|^2$  v.s.  $n$

9) What about more complex functions of  $\hat{r}$ ?

for example  $V(x) = V_0 \exp\left\{-\lambda\left(\frac{x}{a}\right)^4\right\}$

There is a unitary transformation  $U$  that can get  $\hat{X}$  on a diagonal form

$$\hat{X} = U \hat{X}_d U^+ = U \text{diag}\{\lambda_1, \dots, \lambda_N\} U^+$$

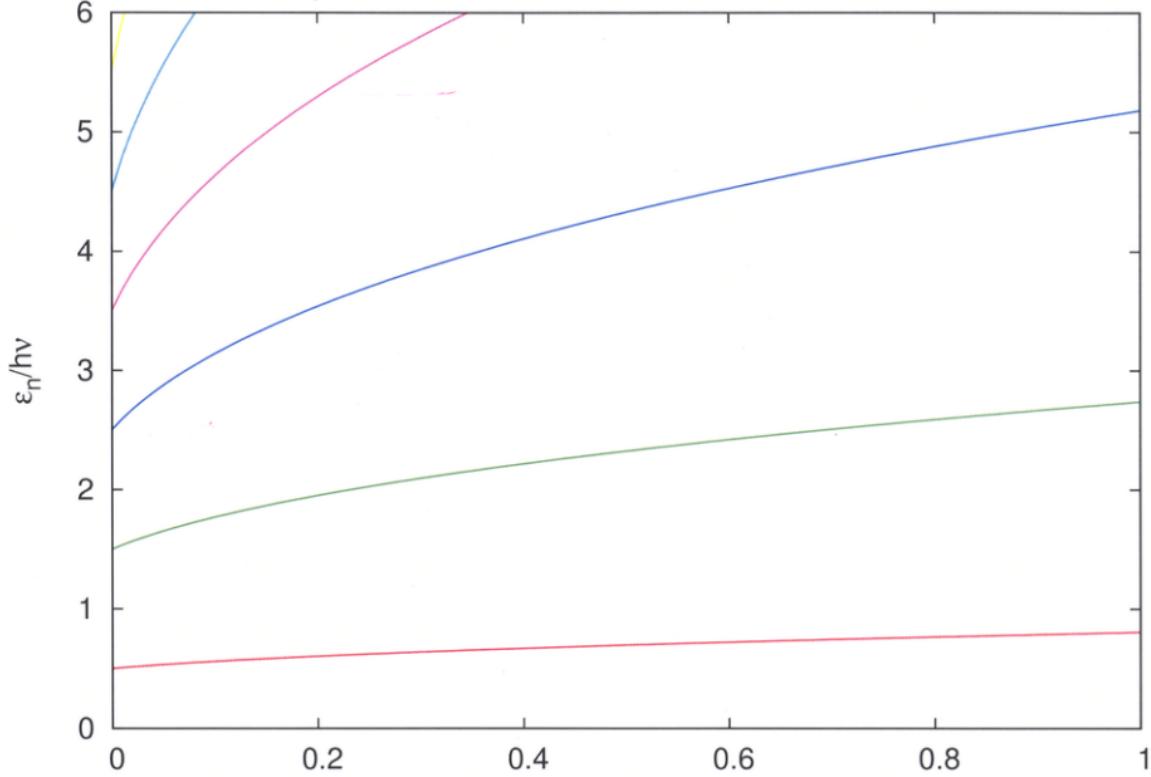

$$\rightarrow f(\hat{X}) = U \text{diag}\{f(\lambda_1), \dots, f(\lambda_N)\} U^+$$

where  $\lambda_i$  is the  $i^{\text{th}}$  eigenvalue of  $\hat{X}$  and  $U$  is the unitary matrix formed of its eigenvectors.

Find the spectrum of  $H' = H_0 + V$  for some appropriate  $\lambda, V_0$  and truncation of the basis  $\{|n\rangle\}$ . Explore the convergence.

Orbitalf  $H = \frac{p^2}{2m} + \frac{1}{2}m\omega^2x^2 + \lambda \tan\left(\frac{x}{a}\right)^4$
